**PROTEIN FOR RECOVERY**

**PROTEIN STRUCTURES**
Protein structures in the body are constantly turning over, breaking down and rebuilding with new amino acids from the diet.

**EXERCISE**
Exercise accelerates this process and promotes the creation of new muscle proteins, a process that is most effective when the athlete eats protein to deliver new amino acids.

**TYPES OF PROTEIN**
Consume high-quality, complete protein sources that are rapidly absorbed and rich in leucine.

**WHEY AND MILK PROTEIN ARE GREAT CHOICES**

**WHEY AND MILK PROTEIN**
- meet all the criteria
- have been shown to be effective for recovery

**LEUCINE**
- one of the amino acid building blocks for new muscle
- acts as a signal for the muscle to start the process of assembling new muscle proteins

**EXAMPLE PROTEIN CONSUMPTION CYCLE**
To get the most out of their workout, athletes should consume protein regularly throughout the day.

**RECOMMENDED AMOUNT**
MORE ISN’T BETTER.

Research shows that ~20 g of protein is the right amount to stimulate post-exercise muscle protein synthesis for most athletes.

If you want to get specific for your athlete, calculate 0.25 g/kg.
